

SEO Audit for led-sign.ca

This report grades your website based on the strength of various SEO factors such as On Page Optimization, Off Page Links, Social and more. The overall Grade is on a A+ to F- scale, with most major, industry leading websites in the A range. Improving your grade will generally make your website perform better for users and rank better in search engines. There are recommendations for improving your website at the bottom of the report. Feel free to reach out to us if you'd like us to help with improving your website's SEO!

On-Page SEO Results

Your On-Page SEO is very good!

Congratulations, your On-Page SEO is well optimized. On-Page SEO is important to ensure Search Engines can understand your content appropriately and help it rank for relevant keywords. You can continue to build on your strong position through testing content improvements for gradual gains.

Title Tag

You have a Title Tag of optimal length (between 50 and 60 characters).

Custom Signs, LED Signs & Banners Toronto | Neon LED Sign

Length : 57

The Title Tag is an important HTML element that tells users and Search Engines what the topic of the webpage is and the type of keywords the page should rank for. The Title will appear in the Header Bar of a user's browser. It is also one of the most important (and easiest to improve) On-Page SEO factors.

We recommend setting a keyword rich Title between 50–60 characters. This is often simple to enter into your CMS system or may need to be manually set in the header section of the HTML code.

Meta Description Tag

Your page has a Meta Description of optimal length (between 120 and 160 characters).

Design and order custom signs, Neon LED signs, retractable banners, business cards, and marketing materials online. Fast turnaround in the Toronto Area.

Length : 152

Meta Description is another important HTML element that explains more descriptively to Search Engines what your page is about. Meta Descriptions are often used as the text snippets used in Search Engine results (though Search Engines are increasingly generating these themselves) and can help further signal to Search Engines what keywords your page should rank for.

Make sure your page has a Meta Description included, and is at an optimum length (between 120 and 160 characters). Make your Meta Description text interesting and easy to comprehend. Use phrases and keywords relevant to the page and user that you would like to rank for. Meta Description is normally available to be updated in your CMS.

SERP Snippet Preview

This illustrates how your page may appear in Search Results. Note, this is intended as a guide and Search Engines are more frequently generating this content dynamically.

Nano Signs

<https://led-sign.ca>

Custom Signs, LED Signs & Banners Toronto

Design and order custom signs, Neon LED signs, retractable banners, business cards, and marketing materials online. Fast turnaround in the Toronto ...

The SERP Snippet illustrates how your page may be shown in Search Results for a particular query. Typically the page's Title, URL and Meta Description have been the main components utilized here, and hence could be carefully dictated, though Search Engines are more frequently building these snippets themselves to better represent the page content to their searchers.

It's important that the SERP Snippet is enticing for your searchers to click on, and accurately represents your content to avoid bounces or heavy re-writing by the Search Engine. You should keep these factors in mind when populating the page Title, Meta Description and URL.

Hreflang Usage

Your page is not making use of Hreflang attributes.

Hreflang is an HTML attribute used to specify the language and geographical targeting of a page. It is commonly used together with the 'alternate' attribute in the code of a page to signal to Search Engines a list of alternative language or geographic versions of the current page.

If you have multiple versions of the same page in different languages, it is important to add Hreflang tags to tell Search Engines about these variations. This code may need to be manually added into the HTML code of your page, but is also often controlled by your CMS or plugin system if multi-lingual features are enabled.

Language

Your page is using the Lang Attribute.

Declared: en-CA

The Lang Attribute is used to describe the intended language of the current page to user's browsers and Search Engines. Search Engines may use the Lang Attribute to return language specific search results to a searcher, and in the browser, Lang Attribute can signal the need to switch to a different language if it is different to the user's own preferred language.

We recommend adding the Lang Attribute to the HTML tag of every page to avoid any chance of misinterpretation of language. This may need to be manually added to the site's HTML code, or may be controlled by your CMS.

H1 Header Tag Usage

Your page has a H1 Tag.

TAG	VALUE
H1	Top Custom Signs, Digital Displays & Banners in the Greater Toronto Area — Nano Signs

The H1 Header Tag is one of the most important ways of signaling to Search Engines the topic of a page and subsequently the keywords it should rank for. The H1 Tag normally appears as visible text in the largest font size on the page.

We recommend adding a H1 Header Tag near the top of your page content and include important keywords you would like to rank for. You should have one, and only one H1 tag on each page. If you are using a CMS, this would normally be entered into the core content section of the page.

H2-H6 Header Tag Usage

Your page is making use multiple levels of Header Tags.

HEADER TAG	FREQUENCY
H2	6
H3	9
H4	1
H5	0
H6	0

The H2-H6 Header Tags are an important way of organizing the content of your page and signaling to Search Engines the longer tail topics your page should rank for.

We recommend including at least 2 other Header Tag levels on your page (such as H2 and H3) in addition to the H1. It is useful to also include important keywords in these Header Tags. These would be added to the core content section of your page.

Heading Structure

Your heading tags appear to be well structured, with no skipped levels or empty headings.

H3 Products

H4 Popular Signage Guides & Insights

Heading tags should form a logical outline of the page: levels should not skip downwards (an H2 followed directly by an H4), and every heading should contain actual text. Search engines and LLMs use the heading hierarchy to understand how your content is organized, and screen readers use it for navigation - a broken outline makes the page harder to parse for both.

Structure headings sequentially: the page title as H1, main sections as H2, subsections as H3, and so on. Never pick a heading level for its font size - style it with CSS instead. Remove or fill any headings that contain no text, and give image-only headings alt text so the image can act as the heading.

Keyword Consistency

Your page's main keywords are not distributed well across the important HTML Tags.

Your page content should be focused around particular keywords you would like to rank for. Ideally these keywords should also be distributed across tags such as the title, meta and header tags.

KEYWORD	TITLE	META DESCRIPTION TAG	HEADINGS TAGS	PAGE FREQUENCY	
custom signs	✓	✓	✓	3	
nano signs	✗	✗	✓	4	
displays	✗	✗	✓	7	
signs	✓	✓	✓	9	
retractable banners	✗	✓	✗	3	
car magnets	✗	✗	✗	3	
led display	✗	✗	✗	3	
led signs	✓	✓	✓	2	

A page should be targeted to rank for a particular set of keywords or phrases, and those terms should be used with some consistency in the page content (naturally and without stuffing) to maximize its ranking potential. This check identifies the terms your page appears to be targeting - the words and multi-word phrases used most prominently and frequently in the content - and shows whether each one also appears in the page's most important HTML Tags: the Title, Meta Description and Header Tags.

Review the identified terms against your intended ranking keywords. If a term you want to rank for is missing, or does not appear in the Title, Meta Description or Header Tags, consider amending your page content and those tags to include it more consistently.

Amount of Content

Your page has a low volume of text content which search engines can interpret as 'thin content'.

Word Count: 685

It has been well researched that higher text content volumes are related to better ranking ability in general.

Numerous studies have shown that there is a relationship between the amount of content on a page (typically measured in word count) and it's ranking potential - generally longer content will rank higher. Obviously content also needs to be topically relevant, keyword rich and highly readable for the visitor. Note, in our assessment, we look at all selectable text on the page at load time, not hidden content.

As a general guideline, it is recommended to have atleast 500 words of content on a page to give it some ranking potential. However this should be considered on a case by case basis. It may not be relevant for particular pages like 'contact us' pages for example.

Image Alt Attributes

You do not have any images missing Alt Attributes on your page.

Alternate Image Text or Alt Text is descriptive text that is displayed in place of an image if it can't be loaded, as well as a label on an image when it is moused over in the browser, to give more information to the visitor. Additionally, Search Engines use provided Alt Text to better understand the content of an image. Image SEO is not widely known, but having your image rank for image searches is an overlooked way of gaining traffic and backlinks to your site.

We recommend adding useful and keyword rich Alt Text for pages's main images, in particular those that could have ranking potential. This should be considered on a case-by-case basis. Often there may be imagery such as UI components or tracking pixels where it may not be useful to add Alt Text, though we have tried to filter a number of these out in our analysis.

Canonical Tag

Your page is using the Canonical Tag.

<https://led-sign.ca>

The Canonical Tag is a HTML Tag that tells Search Engines the primary URL of a page. URLs can have multiple versions due to things like parameters being passed or www and non-www versions, resulting in potential duplicate content. Google recommends all pages specify a Canonical for this reason.

You may need to determine what the primary preferred version of the page is. Often the CMS may manage this, or provide the ability to specify it.

SSL Enabled

Your website has SSL enabled.

SSL or Secure Socket Layer, is a security technology that encrypts data between your website and a visitor. It ensures that the transfer of sensitive data like passwords and credit cards are done securely. Using SSL on all pages is a modern standard, and Search Engines have made it a ranking signal in recent years.

SSL can often be switched on quite simply in systems like Wordpress, Wix etc. Often in more custom websites though, it may require the help of a technical resource to install and configure this on your website. After installation, test that your website loads successfully at a HTTPS:// location.

HTTPS Redirect

Your page successfully redirects to a HTTPS (SSL secure) version.

SSL is a security technology which ensures sensitive data like passwords and credit cards are sent securely between your website and visitors. If you have SSL enabled, it is also very important to ensure that your page is actually forcing usage of HTTPS by redirecting from a non-secure HTTP version to secure HTTPS version. Not doing this means users and Search Engines may continue to access insecure versions, which can also reduce your ranking ability.

Often systems like Wix or Shopify will make it easy to enable, and redirect to SSL versions. If you have Wordpress, or a custom built site, you may require a developer's involvement to ensure that pages are being redirected to their new HTTPS versions. This can be done within a site's configuration or htaccess rules.

Robots.txt

Your website appears to have a robots.txt file.

<http://led-sign.ca/robots.txt>

Robots.txt is a text file that provides instructions to Search Engine crawlers on how to crawl your site, including types of pages to access or not access. It is often the gatekeeper of your site, and normally the first thing a Search Engine bot will access.

We recommend always having a robots file in place for your site. These can be automatically created using a free online utility, Wordpress plugin, or your CMS's robots.txt creation process.

Search Engines Blocked by Robots.txt

Your page is crawlable by the major search engines.

The robots.txt file includes important instructions to Search Engines on how to crawl a site, including instructions to ignore particular pages (effectively 'blocking' them). Sometimes these instructions are added intentionally for low value pages, but sometimes they are left over by mistake when a website goes live, or can be written incorrectly excluding more pages than desired.

If you want the page to rank and it's blocked by a rule in robots.txt, you may need to review your robots rules to understand why it's being blocked, and remove the rule. Because robots.txt instructions are a type of code, this may require the help of a developer to correct.

Noindex Tag Test

Your page is not using the Noindex Tag which prevents indexing.

A critical part of a page's ranking potential is ensuring that it can actually be accessed by Search Engines. The Noindex Tag, when used on pages, tells Search Engines to ignore a page, and can destroy out it's ranking ability. Sometimes these tags are added intentionally for low value pages, but sometimes they are left over unintentionally from a theme or template that has been used on the site, or forgotten to be removed by a developer when a website moves from design and testing to live usage.

If you want the page to rank and it's using a Noindex Tag, you will need to remove the tag from your page's HTML entirely. This may require access to the frontend HTML code, and may need to be done by a developer. If you are using a CMS, you may have an option enabled to prevent indexing of the page, which should be turned off.

Noindex Header Test

Your page is not using the Noindex Header which prevents indexing.

A critical part of a page's ranking potential is ensuring that it can actually be accessed by Search Engines. The Noindex Header is another Noindexing method that tells Search Engines to ignore a page, and can destroy out it's ranking ability. Sometimes these tags are added intentionally for low value pages, but sometimes they are left over unintentionally from a theme or template that has been used on the site, or forgotten to be removed by a developer when a website moves from design and testing to live usage.

If you want the page to rank and it's using a Noindex Header, you will need to remove the Noindex Header from your page. This may require access to the backend code, and may need to be done by a developer. If you are using a CMS, you may have an option enabled to prevent indexing of the page, which should be turned off.

XML Sitemaps

Your website appears to have an XML Sitemap.

<https://led-sign.ca/sitemap.xml>

A Sitemap is an XML data file on your site that lists all of your site's pages that are available for crawling together with other useful information like last update times and crawling priority. Sitemap files help Search Engines find all your pages to give them the highest chance of being indexed and ranked.

We recommend always having a Sitemaps file in place for your site. Sitemaps can be created manually using a utility, Wordpress plugin, or your CMS's Sitemap creation process. Additionally, the Sitemap should be referenced in your robots.txt file.

Analytics

Your page is using an analytics tool.

Google Analytics

Web Analytics Tools like Google Analytics allow you to analyze your website's performance and understand your visitors better.

We recommend using an analytics tool on your site. Analytics tracking code can be installed manually into page code with the help of a developer or enabled as a feature of your CMS.

Schema.org Structured Data

You are using JSON-LD Schema on your page.

DETECTED SCHEMA TYPES

LocalBusiness

PostalAddress

GeoCoordinates

OpeningHoursSpecification

FAQPage

Question

Answer

Schema.org Structured Data Markup is a collection of data tags that can be added to your site to allow Search Engines to more easily interpret the content and use it to enhance Search Results. For example there are tags for providing information about your Local Business such as address and phone number, or adding product information on e-commerce pages so that these products can be displayed in shopping aggregators like Google Shopping.

It is a good idea to start incorporating some relevant Schema.org tags into your site to improve interpretation and display by Search Engines.

Generative Engine Optimization (GEO)

Your Generative Engine Optimization is very good!

Congratulations, your Generative Engine Optimization (GEO) appears well positioned. GEO is important to ensure LLMs and AI Search Engines can effectively crawl your content and understand the underlying entity structure. Our knowledge of GEO is improving rapidly though, so stay on top of the latest understanding and optimizations.

Rendered Content (LLM Readability)

Your page has a low level of rendered content which tends to make it more readable for LLMs.

Rendering Percentage: 0%

LLMs and AI Crawlers predominantly read the raw HTML of a website instead of the completed, dynamically rendered HTML produced in a web-browser, that may have been updated by Javascript. This stems from LLMs being naturally optimized to parse static content like documents and files as well as the fact that rendering website Javascript at scale is expensive, slow, and can be less consistent.

You should ensure that important site content is always present in the raw HTML of your site and minimize the usage of plugins and Javascript components known to add content dynamically. This requires a moderate technical understanding to achieve and test.

llms.txt

Your website appears to have a llms.txt file.

llms.txt is a proposed standard for websites to guide large language models (LLMs) to better understand your site's content.

<http://led-sign.ca/llms.txt>

llms.txt is a proposed standard file for websites to help large language model (LLM) crawlers understand a site's content more efficiently. The file offers brief background information, guidance, and links to documentation sources.

We suggest adding a llms.txt markdown file to your site. This can be automatically created with a free utility, plugin, or by your website CMS automatically.

AI Crawlers Blocked by Robots.txt

Your robots.txt allows the major AI crawlers to access your site.

Generative engines like ChatGPT, Google AI Overviews, Perplexity and Claude use their own crawlers to read and cite web content. If your robots.txt blocks these AI crawler user-agents, those engines cannot access your pages and are far less likely to surface or cite your business.

Review your robots.txt for Disallow rules that target AI crawler user-agents (such as GPTBot, Google-Extended, ClaudeBot, PerplexityBot and CCBot). If you want to be visible in AI answers, remove those rules so the crawlers can access your content.

Entity Definition

Your page clearly defines the entity it represents.

The page clearly identifies Nano Signs as a Toronto-area provider of custom signage, displays, banners, and printing.

LLMs and AI Search Engines need to clearly identify the entity (business, organization, or person) a page represents in order to attribute, trust and recommend it confidently.

Make the entity name and what it does prominent and unambiguous through clear headings, an intro or about section, and consistent naming, so both people and AI can identify who you are.

Contact Transparency

Your page clearly provides business details and contact points.

The page provides phone, email, Toronto location, contact links, quote access, and multiple official social-profile icons.

Explicit business details such as legal name, registration numbers, address and contact methods build trust and help AI verify, attribute and cite the business.

Publish clear company and contact information (name, address, phone, email, and registration or VAT numbers where applicable), typically in the footer and on a dedicated contact page.

Answer Alignment

Your page includes clear question-and-answer style content.

The page includes a clearly labeled FAQ section with several question-style headings and answers about products and ordering.

Content in explicit question-and-answer format (such as an FAQ) maps directly to the queries people ask LLMs, making it easier for your content to be surfaced and cited.

Add an FAQ section, or structure relevant content as clear questions with concise, self-contained answers beneath them.

Citation Readiness

Your page contains easily citable facts, quotes or statistics.

The page contains substantive, self-contained claims about services, coverage, production capabilities, support, and ordering policies.

Self-contained, factual snippets such as statistics, quotes and data points are the kind of content LLMs prefer to quote and cite when answering questions.

Include concrete facts, statistics and quotable statements written as clear, self-contained sentences that still make sense when cited on their own.

Content Structure

Your page is well structured and easy for AI to parse.

The page uses clear headings, categorized product grids, benefit cards, gallery sections, and FAQ accordions for strong scanability.

Well-structured, scannable content - with clear headings, lists and short paragraphs - is far easier for LLMs to parse, chunk and reuse when answering questions.

Break content into a clear heading hierarchy with sub-headings, bulleted or numbered lists, tables and short digestible paragraphs rather than dense blocks of text.

Content Freshness

Your page shows only weak signals that its content is current.

The copyright range extends through 2026, but no publication, update, event, or current pricing dates are provided.

Generative engines favour content that appears current. Visible recency signals such as dates and recent information make your page more likely to be surfaced and cited.

Show publish or "last updated" dates, reference the current year and recent information, and keep details such as prices and events up to date.

Authority & Trust Signals

Your page shows authority and trust signals, though these could be stronger.

The page presents a detailed company identity, Toronto location, client gallery, service promises, and contact details, but lacks certifications or external endorsements.

LLMs prefer to cite sources that appear credible. Visible authority and trust signals - author credentials, certifications, awards, trust badges and press mentions - make your page a more citable source.

Surface author names and credentials, certifications, awards, recognisable trust badges, press or "as featured in" mentions, and cite your sources.

Top AI Overview Citations

This shows the top searches for which an AI Overview is displayed with a citation link to your site.

KEYWORD	LOCATION	POSITION	TOTAL SEARCHES	ESTIMATED TRAFFIC
led sign ca	(Canada)	8	70	1

AI Overviews are a new feature from Google that shows an AI-generated summary response to the query. They most often appear for informational queries at the top of the results page above the Organic SERP. Oftentimes these AI Overviews themselves will cite other sources such as articles and websites and these sources are shown in the AI Overview and can still drive some traffic to the site.

Rankings

Traffic From Search

This shows the Estimated Traffic Volume your page receives in a month from Google Searches.

56

Google Organic

0

Paid

1

AI Overviews

A search in Google can often result in traffic to your site from searchers clicking on links in different parts of the search result (SERP). This check shows an estimate of the Monthly Visitors your site receives as a result of these clicks in the Organic, Paid and AI Overview section of the search result. Traffic can be estimated by understanding the full set of keywords your site ranks for and multiplying those keywords monthly search volumes by an average click-through-rate for those positions.

Top Organic Keyword Rankings

This shows the top 10 Keywords driving traffic from Google Organic Searches. The list is ordered by the keywords that drive the most traffic to your page (have the highest Estimated Traffic Volume).

KEYWORD	LOCATION	POSITION	TOTAL SEARCHES	ESTIMATED TRAFFIC	
led sign ca	(🇨🇦)	1	70	21	
led sign board	(🇨🇦)	7	170	4	
led sign	(🇨🇦)	24	1,000	2	
led signs	(🇨🇦)	37	1,000	2	
signage led	(🇨🇦)	47	1,000	2	
signage boards	(🇨🇦)	40	880	2	
custom led signs	(🇨🇦)	33	720	2	
led lights signs custom	(🇨🇦)	34	720	2	
programmable led signs	(🇨🇦)	10	110	1	
digital signs and printing	(🇨🇦)	46	260	1	

A goal of Search Engine Optimization is to improve the ranking of your website for particular keywords to drive more clicks and traffic to your site. The Top Organic Keyword Rankings check shows you the keywords that your site is currently ranking for in the normal '10 blue links' organic segment of a Google search result, ordered by those that are likely driving the most traffic to your site. Note this data is a snapshot and may be several weeks old in some cases.

Organic Keyword Positions

This shows you a summary of the positions for your Organic Keyword Rankings. The higher you rank, the more likely you are to capture traffic, with recent research showing that as much as 92% of clicks happen on the first page.

POSITION	KEYWORDS	
Position 1	1	
Position 2-3	0	
Position 4-10	2	
Position 11-20	8	
Position 21-30	16	
Position 31-100	28	

Keyword Positions shows a summary of the number of keywords a site ranks for in organic search, grouped by their position. Generally the higher a ranking position for a Search Term, the more traffic the site will receive. It has been researched that top 3 positions account for as many as 60% of clicks, so moving up to higher positions is very valuable goal of SEO Optimization.

Links

Descriptive Anchor Text

The internal links on your page appear to use descriptive anchor text.

Anchor text is the visible, clickable text of a link. Search engines use it to understand what the destination page is about, so descriptive anchors like "pricing plans" pass far more relevance than generic ones like "click here" or "read more". Links with no text at all (for example unlabeled icon links) pass no signal and are also unusable for screen reader users, and raw URLs used as the visible text are hard to read and waste the same opportunity.

Rewrite generic anchors to describe the destination page, ideally using its target keywords naturally. Give icon-only links an accessible name via image alt text or an aria-label, and replace raw URLs shown as link text with a readable phrase.

Usability

Your usability could be better

Your page is OK but could be more usable across devices. Usability is important to maximize your available audience and minimize user bounce rates (which can indirectly affect your search engine rankings).

Device Rendering

This check visually demonstrates how your page renders on different devices. It is important that your page is optimized for mobile and tablet experiences as today the majority of web traffic comes from these sources.

A website can be viewed in a wide variety of resolutions and formats, some dictated by the size of a desktop display, and others by the specific dimensions of a phone or tablet model. Device rendering provides a preview of how the site looks on some popular device resolutions to help identify obvious issues. Note, our method will load a website and resize it's portlet to several dimensions, as opposed to loading the site multiple times directly in different devices.

In general a website should be designed and tested to be responsive across a large variety of desktop and mobile device resolutions, as well as being able to transition smoothly (for example when resizing a browser or flipping a tablet from vertical to horizontal).

Use of Mobile Viewports

Your page specifies a Viewport matching the device's size, allowing it to render appropriately across devices.

```
<meta name="viewport" content="width=device-width, initial-scale=1, maximum-scale=5">
```

The Viewport is a Meta Tag within the page's HTML which gives the browser instructions for how to control the page's dimensions and scaling. Setting the Viewport is particularly important for mobile and tablet device responsiveness, as without it, the page can appear incorrectly sized and require zooming or scrolling to view content.

Make sure you include one Meta Viewport tag in the Head section of page HTML.

Google's Core Web Vitals

Google is indicating that they do not have 'sufficient real-world speed data for this page' in order to make a Core Web Vitals assessment. This can occur for smaller websites or those that are not crawl-able by Google.

Core Web Vitals are UI Metrics designed by Google that measure the overall quality of user experience on your site. They assess things such as the appearance of content, interactivity of the page and visual stability from the moment of page load. Core Web Vitals are gathered from real world usage data of a website (hence some smaller websites that haven't been well sampled may not return an appropriate result). Google has made Core Web Vitals a ranking factor for pages with increasing importance.

To improve your Core Web Vitals scores, you may need to read Google's documentation on the topic and follow the recommendations provided in the Google's PageSpeed Insights assessment.

Google's PageSpeed Insights - Mobile

Google is indicating that your page is scoring poorly on their Mobile PageSpeed Insights evaluation.

Note that this evaluation is being performed from US servers and the results may differ slightly from an evaluation carried out from Google's PageSpeed Web Interface as that reporting localizes to the region in which you are running the report.

Google has indicated that the performance of a webpage is becoming more important from a user and subsequently ranking perspective.

LAB DATA	VALUE	OPPORTUNITIES	ESTIMATED SAVINGS
First Contentful Paint	2 s	Render-blocking requests	0.85 s
Speed Index	4.5 s	Reduce unused JavaScript	0.75 s
Largest Contentful Paint	8.6 s	Avoid multiple page redirects	0.63 s
Time to Interactive	9.7 s	Reduce unused CSS	0.3 s
Total Blocking Time	0.59 s	Legacy JavaScript	0.3 s
Cumulative Layout Shift	0	Use efficient cache lifetimes	0.15 s

PageSpeed Insights is a tool from Google that evaluates a website's performance in both mobile and desktop, providing suggestions for how to improve it. Google has indicated that performance is becoming a more important ranking factor, so understanding Google's own analysis of your site is valuable. Also irrespective of SEO rankings, it has been well researched that pages that load faster perform better in user bounce rate and conversions.

We recommend reviewing and implementing some of Google's listed opportunities to improve your site.

Google's PageSpeed Insights - Desktop

Google is indicating that your page is scoring well on their Desktop PageSpeed Insights evaluation.

LAB DATA	VALUE	OPPORTUNITIES	ESTIMATED SAVINGS
First Contentful Paint	0.4 s		
Speed Index	0.9 s	Render-blocking requests	0.45 s
Largest Contentful Paint	0.9 s	Avoid multiple page redirects	0.19 s
Time to Interactive	1.7 s		
Total Blocking Time	0.05 s		
Cumulative Layout Shift	0.001		

PageSpeed Insights is a tool from Google that evaluates a website's performance in both mobile and desktop, providing suggestions for how to improve it. Google has indicated that performance is becoming a larger ranking factor, so understanding Google's own analysis of your site is valuable. Also irrespective of SEO rankings, it has been well researched that pages that load faster perform better in user bounce rate and conversions.

We recommend reviewing and implementing some of Google's listed opportunities to improve your site.

Image Dimensions

The images on your page appear to have explicit dimensions set.

Images without explicit width and height attributes force the browser to guess how much space they will occupy. When the image finally loads, the surrounding content jumps to make room - a "layout shift" that makes the page feel unstable and hurts the Cumulative Layout Shift metric within Core Web Vitals.

Add width and height attributes (or CSS aspect-ratio) to the flagged images so the browser can reserve the correct space before each image loads. The values only need to describe the image's proportions - responsive CSS can still scale the rendered size.

Render-Blocking Resources

Your page has resources that are blocking the first paint of the page.

Deferring or inlining these files can make your page render noticeably faster.

RESOURCE	SIZE	EST. DELAY
https://led-sign.ca/_next/static/css/0d0572e4cc4ceed7.css	19.87KB	0.60s
https://led-sign.ca/_next/static/css/59cc0ede96238b77.css	4.64KB	0.15s

Render-blocking resources are stylesheets and scripts that the browser must fully download and process before it can draw anything on the screen. Every render-blocking file adds a delay between a visitor requesting your page and actually seeing content, which directly worsens load-speed metrics like First Contentful Paint and Largest Contentful Paint.

Review the flagged files and move them out of the critical path: load non-essential scripts with the defer or async attributes, inline the small amount of CSS needed for the visible part of the page, and load the remaining styles asynchronously. Removing unused stylesheets and scripts entirely is even better.

Flash Used?

No Flash content has been identified on your page.

Flash is an old embedded website technology that was frequently used in heavily animated features such as games and videos. However, Flash is not supported by all mobile devices and is not easily read by search engines. Improvements to HTML and CSS and the increased speed of modern web browsers have made it possible to implement many similar features with standard web technologies.

If Flash is detected on your site, you should carefully consider whether it is necessary due to the several drawbacks.

iFrames Used?

There are no iFrames detected on your page.

iFrames are a HTML tag that allow you to embed other webpages inside your page in a small frame. They generally represent an older coding practice and are discouraged as they can complicate navigation, particularly in mobile, and are harder for search engines to index.

We recommend removing any iFrames if they don't serve a critical purpose, or could be replaced with more natural navigation. However, some coding libraries like Google Tag Manager may still rely on iFrames as part of their internal functionality to load external pages and code files, so you may need to evaluate your usage of them on a case by case basis.

Favicon

Your page has specified a Favicon.

[https://led-sign.ca/images/nano logo O-toronto-printing-ca.png](https://led-sign.ca/images/nano%20logo%20O-toronto-printing-ca.png)

A Favicon is a small icon that serves as branding for your website. It's main purpose is to help visitors locate your page easier when they have multiple tabs open. It adds legitimacy to your site and helps boost your online branding as well as trust from potential consumers.

Either use an online Favicon builder tool, or a graphic designer to build your Favicon, and load them into your website or CMS.

Email Privacy

Email addresses have been found in plain text.

We recommend removing any plain text email addresses and replacing them with images or contact forms. Plain text email addresses can be susceptible to scrapers and email spammers.

LINE	EMAIL
1	info@led-sign.ca
1	info@led-sign.ca
1	info@led-sign.ca
1	info@led-sign.ca
1	info@led-sign.ca

Email addresses shown in clear text on your website can be easily scraped by bots, leading to inclusion in spam mailing lists.

We recommend removing any plain text email addresses and replacing them with contact forms, images, or less obvious text like 'email at website'.

Performance Results

Your performance is good

Your page has performed well in our testing meaning it should be reasonably responsive for your users, but there is still room for improvement. Performance is important to ensure a good user experience, and reduced bounce rates (which can also indirectly affect your search engine rankings).

Website Load Speed

Your page loads in a reasonable amount of time.

Server Response

All Page Content Loaded

All Page Scripts Complete

Page Load Speed refers to the amount of time it takes to entirely load a webpage in a user's browser. Load speed is complex and can be impacted by a multitude of factors including network, web server, page size, technology, database or coding problems, and may require the help of a developer or systems administrator to troubleshoot. Page Load Speed impacts a user's experience on a website and can directly impact bounce rate and conversions. Additionally, Search Engines are making Page Load Speed a ranking factor.

Optimize Page Load Speed by examining common problem points such as overall file size, server resources or coding problems.

Website Download Size

Your page's file size is reasonably low which is good for Page Load Speed and user experience.

Download Page Size

Download Page Size Breakdown

HTML	0.05MB
CSS	0.02MB
JS	0.9MB
Images	0.13MB
Other	0.58MB

Download Page Size refers to the total amount of file content that needs to be downloaded by the browser to view a particular webpage. This includes HTML, CSS, Javascript and Images, though can include a number of other file formats. Generally media files like images and videos are significantly larger than text files and make up the bulk of Download File Size, but also represent the largest optimization opportunity. An important distinction here is 'Download' vs 'Raw' file size. Modern web protocols compress files during transfer, meaning files are usually smaller to download than their actual or 'raw' size. So any manual optimizations you perform would be on the 'raw' file. Download Page Size is one of the biggest contributors to Page Load Speed, which can directly affect rankings, user experience and conversions.

It is important to ensure your Download File Size is as small as possible by removing unnecessary files and minifying and optimizing others. 5MB is a good metric to strive for, though modern websites are gradually increasing in size.

Compression Usage (Gzip, Deflate, Brotli)

Your website appears to be using a reasonable level of compression.

Modern web servers allow website files to be compressed as part of their transfer, often dramatically reducing the Download File Size and Page Load Speed of a page. There are several different compression algorithms used such as GZIP, Deflate and Brotli. Enabling compression can often represent a simple and quick win to performance, and most new web servers will have this enabled by default.

You should ensure that compression is enabled and working effectively on your web server. Sometimes compression may only be partially enabled for particular file types, or using an older compression method, so it is important to understand whether your server is configured as efficiently as possible. This may require the help of a developer to investigate.

Resources Breakdown

This check displays the total number of files that need to be retrieved from web servers to load your page.

When browsers display a modern website, they have to retrieve a wide variety of files including HTML, CSS, Javascript, Images and other media. As a general rule, every file that needs to be retrieved is another network request that needs to be made by the browser to the server, which can each face some connection overhead and add to Page Load Time.

It is a good idea to remove unnecessary files or consolidate smaller files with similar content like styles and scripts where possible to optimize performance.

Image Optimization

All of the images on your page appear to be optimized.

Image and media files in general tend to be the largest component of file size on most modern webpages. File size can directly impact how quickly a page loads, and subsequently the quality of the experience for users. Images in general can have a large range in how much they can be optimized. For example, a high quality photograph downloaded from a camera could be 16MB, but using a reasonable level of size reduction and optimization could comfortably reduce it to 150KB without a noticeable amount of quality loss.

Review the images used on your site, starting from the largest in file size to determine if there are optimization opportunities. You can use common image editing tools like Photoshop or even free online compression tools to optimize them.

Browser Caching

Some files on your page are served with short or missing cache lifetimes.

Longer cache lifetimes let returning visitors load your page much faster.

RESOURCE	CACHE LIFETIME	SIZE
https://led-sign.ca/images/hero-mobile-1.webp	None	23.80KB

Browser caching lets returning visitors reuse files their browser has already downloaded - stylesheets, scripts, images and fonts - instead of fetching them again. Files served with a short cache lifetime (or none at all) must be re-downloaded on every visit, making repeat page loads slower than they need to be.

Configure your web server to send long cache lifetimes for static files, for example via Cache-Control headers. A common pattern is a long lifetime (a month or more) combined with a version number in the file name or URL, so a file can still be updated instantly by changing its URL.

JavaScript Errors

Your page is not reporting any JavaScript errors.

JavaScript is embedded code on a webpage that can perform any number of functions such as modifying page elements dynamically, or making calls to retrieve information live without refreshing the page. JavaScript is a staple of the modern web and used on almost every modern website. However, with increasing usage and complexity, Javascript can fail on a page due to coding problems, incorrect versions or loading issues. Sometimes failures can interrupt proper execution of a page and break other functions, and so Javascript errors should generally be examined to understand the cause and what its impacts are .

HTTP2 Usage

Your website is using the recommended HTTP/2+ Protocol.

HTTP is a technology protocol used by web browser to communicate with websites and is a cornerstone of the world wide web. HTTP/2 (and above) are newer versions of the HTTP protocol that offer significant performance improvements. Older websites may be set to using an older HTTP protocol despite their web servers having been upgraded to support newer versions.

It is worth reviewing whether your website is configured to use the latest available HTTP protocol as it can provide immediate Page Load Speed improvements.

Minification

All your JavaScript and CSS files appear to be minified.

Minification is a procedure run on code text files that can reduce the text size by removing white space and substituting common values or names with shorter versions. Minification also offers the additional value of making code much harder to read and reverse engineer by third parties. It is best practice to minify any exposed JS and CSS Files before publishing them to a live site.

Minification can be done automatically through some development tools and website build procedures, or through minification CMS Plugins, or manually through minification tools available online.

Deprecated HTML

No deprecated HTML tags have been found within your page.

HTML, like most coding languages, has had improvements made over time that has removed older features, either due to them simply being problematic, or more often replaced with something better. If you continue to use these older features in your page, you may at the bare minimum not get the expected functionality in your page, or in the worst case, break some execution.

It is recommended to identify and remove any old or 'deprecated' tags from your code. This could be done manually if you have HTML or web design skills, or could be done by upgrading the template and library versions on your website.

Inline Styles

Your page appears to be using Inline Styles.

Inline Styles are an older coding practice and discouraged in favor of using CSS style sheets, due to their ability to degrade page load performance and unnecessarily complicate HTML Code.

HTML provides the ability to embed UI styling attributes within individual HTML elements. Despite this feature being available, it is modern best practice to completely separate UI styling into separate CSS files. This separates functions and centralises UI styling into one place making it easier for example to upgrade the UI styling of a site independently of the page content and structure. Inline Styles also have some particular problems in that they can degrade the page load performance of a page and unnecessarily complicate HTML code.

Inline Styles should be manually removed from the HTML code of a page and merged into separate CSS files, but may need the help of a designer to carefully consider their purpose and function.

Social Results

Facebook Page Linked

Your page has a link to a Facebook Page.

 <https://facebook.com/signsnano>

Creating Social Profiles as well as linking to these from your website can help to build trust in your business and provide other mediums to nurture your customer relationships.

We recommend creating all common Social Profiles and linking to these from your website. Most CMS systems will offer fields to enter your Social Profile URLs and will display these in a button row section in the footer.

Facebook Open Graph Tags

Your page is using Facebook Open Graph Tags.

TAG	CONTENT
og:title	Nano Signs Toronto Custom Signs, LED Signs & Banners
og:description	Premium custom signage, Neon LED signs, retractable banners, and commercial print in the Greater Toronto Area.
og:url	https://led-sign.ca
og:site_name	Nano Signs
og:locale	en_CA
og:image	https://led-sign.ca/images/nano%20logo%20O-toronto-printing-ca.png
og:image:width	1200
og:image:height	630
og:image:alt	Nano Signs Logo
og:type	website

Facebook Open Graph Tags are a type of structured data that can be placed on your page to control what is shown when your page is shared on Facebook. You can indicate exactly what content should appear in a sharing snippet's title, description, imagery and other information. This is useful when pages like your homepage, products or articles are shared, and effective sharing can drive traffic and conversions. You may want to ensure that the content presented is correct and has the highest chance of attracting visitors. If you don't define specific content, Facebook may decide automatically which pieces of text and imagery are displayed which may not always be correct or appealing.

We recommend defining as many of Facebook's Open Graph fields as possible, and inserting this code into the HTML of your page. Facebook has a helper tool for creating this content, or sometimes it can be written automatically with the help of a CMS plugin.

Facebook Pixel

We have not detected a Facebook Pixel on your page.

Facebook's Pixel is a useful piece of analytics code that allows you to retarget visitors if you decide to run Facebook Ads in future.

Facebook Pixel is a piece of analytics code that allows Facebook to capture and analyse visitor information from your site. This allows you to retarget these visitors with Facebook messaging in future, or build new 'lookalike' audiences similar to your existing visitors.

It can be a good idea to install a Facebook Pixel if you intend to do any Facebook related marketing in the future in order to prepare audience data.

X (formerly Twitter) Account Linked

Your page has a link to a X Profile.

 <https://x.com/nanosigns1>

X Cards

Your page is using X Cards.

TAG	CONTENT
twitter:card	summary_large_image
twitter:title	Nano Signs Toronto Custom Signs, LED Signs & Banners
twitter:description	Premium custom signage, Neon LED signs, retractable banners, and commercial print in the Greater Toronto Area.
twitter:image	https://led-sign.ca/images/nano%20logo%20O-toronto-printing-ca.png

Similar to Facebook Open Graph Tags, X Cards are a type of structured data that can be placed on your page to control what is shown when your page is shared on X. You can indicate exactly what content should appear in a sharing snippet's title, description, imagery and other information.

We recommend defining as many of X's Cards as possible, and inserting this code into the HTML of your page. X has a cards markup tool for creating this content, or sometimes it can be written automatically with the help of a CMS plugin.

Instagram Linked

Your page has a link to an Instagram Profile.

Local Business Schema is a type of structured data markup that can be added to the code of a webpage. Adding accurate Local Business Schema categories helps Search Engines more understand your website and the business it represents so that it can rank in local search results.

The approach for adding Local Business Schema depends on your website's capabilities. Your CMS may have the ability to input this directly, or you may need to install a Schema app or plugin.

Alternatively you can manually create your Schema through the use of an online Schema Generator tool and copy this into the code of your site.

Google Business Profile Identified

No Google Business Profile was identified that links to this website.

A Google Business Profile (GBP) is a listing representing your business that appears in Google Maps or standard Google Searches that have local intent. GBP contains key information about the business such as name, location, contact information, opening hours as well as customer ratings and reviews. GBP is an important tool for local businesses to manage their online presence, reach customers on Google, and compete against other similar businesses.

If you are a local business, it is important to create your Google Business Profile (or claim it if one has been automatically created by Google) and update the details as completely and accurately as possible. We try to identify your GBP based on the website URL listed in the profile matching the one in this audit. If your GBP profile exists but we can't identify it, you may want to check that the website URL is correct.

Google Business Profile Completeness

No Google Business Profile was identified that links to this website.

It is important your Google Business Profile (GBP) details are complete and correct - in particular those referred to as the 'NAP' - Name, Address Phone. This obviously helps local customers find your business, but also aids local SEO by helping Google accurately identify online citations of your business to understand the online presence, trust and reputation of your business.

We recommend reviewing the details of your business's Google Business Profile and updating it as completely and accurately as possible.

Google Reviews

No Google Business Profile was identified that links to this website.

Google reviews and ratings are critical for a business - they can directly impact customer trust and reputation of your business which drives foot traffic, but are also a ranking signal Google uses to determine how to rank your business in local search results.

Be pro-active in trying to drive reviews for your business (there are multiple methods and online tools to assist) as well as responding to any negative feedback.

DMARC Record

This site appears to have a valid DMARC record in place.

v=DMARC1; p=none

DMARC (Domain-based Message Authentication, Reporting, and Conformance) is a DNS record that can be added for a site to help prevent email spoofing from malicious parties. It is more frequently being adopted as a mailing requirement by email providers like Google and can affect deliverability rates if not in place.

We recommend reviewing the documentation from both your email delivery platform as well as common recipient platforms like Gmail and Outlook to determine the appropriate DMARC records and how to implement this into your site's DNS

SPF Record

This site appears to have an SPF record.

v=spf1 include:_spf.mail.hostinger.com ~all

An SPF (Sender Policy Framework) record is a DNS record that is set to identify mail servers and domains that are allowed to send email on behalf of your domain and is designed to help combat email spoofing.

We recommend reviewing the documentation of all the delivery platforms you use to determine the appropriate SPF records to implement for your site to ensure highest deliverability.
